

Introduction to Computing Lab

Week 1 — Course Overview & Fundamentals

IT115L | 1st Semester | Adamson University CCIT

Learning Objectives

By the end of this module, students should be able to:

- Understand the basic components of a computer system
- Differentiate between hardware and software
- Identify the role of an operating system
- Write and run their first simple program

What is Computing?

Computing refers to any goal-oriented activity requiring, benefiting from, or creating computers. It includes designing and building hardware and software systems, processing and managing information, and using computers to solve problems across every field of human activity.

Key Components of a Computer

Component	Description	Example
CPU	Processes instructions	Intel Core i7
RAM	Temporary memory for active tasks	8GB DDR4
Storage	Permanent data storage	512GB SSD
Input	Devices that send data in	Keyboard, Mouse
Output	Devices that display results	Monitor, Printer

Your First Program

In this lab, we will write a simple program that prints a message to the screen. This is traditionally the first program every developer writes — it confirms your environment is set up

correctly and gives you a feel for the syntax of the language.

In Python, this is as simple as:

```
print("Hello, Forge!")
```

Activity

1. Open the Forge.dev Sandbox
2. Select Python as your language
3. Type: `print("Hello, [Your Name]!")`
4. Click Run and verify the output
5. Try changing the message and run again

Next Week: We will cover variables, data types, and basic arithmetic in Python.
